AN 1991-10061 DRUGU P E S

AB The effects of GI disease on oral contraceptive (OC) efficacy are discussed. The enterohepatic circulation of OC including ethynodiol (EE), mestranol, norethisterone, levonorgestrel, desogestrel, cyproterone acetate (CPA), **chlormadinone acetate**, noretynodrel, etynodiol, lynestrenol and norethisterone acetate, and its modification by other drugs including ampicillin and antacids is discussed. The effects of chronic **inflammatory bowel** disease of OC absorption and efficacy are considered. OC may gave an etiologic role in the development on Crohn's disease.  
(congress).

ABEX The low doses of estrogens and progestogens used in OC mean than any dietary factors affecting bioavailability are relevant to contraceptive efficacy. EE metabolism is described. If EE undergoes enterohepatic circulation, any disruption would increase the risk of contraceptive failure. There is no convincing evidence that ampicillin, erythromycin or trimethoprim effects EE metabolism. In 12 women given an antacid (magnesium trisilicate and aluminum hydroxide) there was no change in the bioavailability of EE, norethisterone acetate or levonorgestrel. Mestranol is rapidly converted to EE and undergoes enterohepatic circulation. Progestogens (norethisterone, levonorgestrel, desogestrel, CPA and **chlormadinone acetate**) do not undergo enterohepatic circulation. Noretynodrel, etynodiol, lynestrenol and norethisterone acetate are metabolized to norethisterone. Desogestrel is converted to 3-ketodesogestrel and norgestimate to norgestrel-17-beta-acetate and levonorgestrel. OC use is associated with an increased risk of Crohn's disease. Ulcerative colitis or ileostomy may result in reduced OC absorption, as may small bowel but not colonic diarrhea, leading to reduced efficacy. (E33/JB)

AB Rats were restrained for 20 hr, and ulcers that developed were counted.

Groups of restrained and control (fasted only) rats were treated with cortisone (75 mg/kg/day), 17-hydroxyprogesterone (125 mg/kg), vitamin A (50 I.U./g) and ACTH (50 I.U./kg). Adrenalectomized rats were highly sensitive to both fasting and restraint. Restraint-induced gastric ulcers differed sharply from cortisone ulcers being characterized by ischemic and coagulative necrosis without evidence of inflammation or epithelial mucin. These ulcers were not prevented by vitamin A.

Cortisone and 17-hydroxyprogesterone greatly reduced the incidence and severity. There was an unexplained ulcer-abetting effect of ACTH.
